

Calculating Physical and Mental Health Summary Scores for PROMIS-29 v2.0 and v2.1

Karen L. Spritzer and Ron D. Hays

The PROMIS-29 Profile measure assesses pain intensity using a single 0–10 numeric pain rating item and seven health domains using four items each: physical functioning, fatigue, pain interference, depression, anxiety, ability to participate in social roles and activities, and sleep disturbance. This memo describes scoring of the PROMIS-29 into two summary scores (physical and mental health) using SAS software. This scoring is valid for versions 2.0 and 2.1. For supporting psychometric analyses, please see Hays, Spritzer, Schalet, and Cella (2018). The PDF version of the PROMIS 29 v2.1 is available on http://www.healthmeasures.net/index.php?option=com_instruments&view=measure&id=849&Itemid=992.

To score the PROMIS-29 Physical Health and Mental Health Summary Scales, users need to ensure that each domain has an associated T-score (except for the numerical pain rating scale). In the example we provide below, the PROMIS-29 Profile domain-level T-scores are obtained using the HealthMeasures Scoring Service, powered by Assessment CenterSM (https://www.assessmentcenter.net/ac_scoringservice). Other options for obtaining domain-level T-scores are described on <http://www.healthmeasures.net/score-and-interpret/calculate-scores>. This includes administration the PROMIS-29 in electronic platforms such as REDCap that produce domain-level T-scores.

In our example, we used the HealthMeasures Scoring Service and SAS software, Version 9.4 (SAS Institute, Inc., Cary, NC, USA) to create an extract of our data (renaming/recoding items when necessary to conform to PROMIS item structure. As seen in Appendix A, “export_AC.sas” creates a comma delimited file “prom29.csv”. Next, we uploaded prom29.csv to the HealthMeasures Scoring Service naming the instrument “prom29_1” and using the default calibration sample (PROMIS Wave 1). “prom29_1.log” (log of information regarding how the data was read and analyzed) and “prom29_1.csv” (output file containing scored results) files were returned to us by email.

As shown in Appendix B, the final step shows score29.sas reading prom29_1.csv and restructuring it

to create one record for each PIN/Assessment with 7 domain scores. It then merges in the 0-10 raw pain intensity item and creates a z-score using the PROMIS Wave 1 general population mean (2.31) and SD (2.34) to create PAIN1_Z. Next, it creates two new composites: PAINAV_Z is the average of this new pain intensity z-score (PAIN1_Z) and the pain interference z-score (PAIN4A_Z), and creates EMOT_Z as the average of the anxiety (ANX4A_Z) and depression (DEP4A_Z) z-scores.

The PROMIS-29 physical health and mental health Z-scores are then calculated as the sum of the product of the factor scoring coefficients (reference below) with the Z-scores.

/* multiply z-scores with corresponding factor scoring coefficients and sum */

```
ph29_z=(phy4a_z * 0.872) +
(painav_z * -0.094) +
(social4a_z * 0.113)
+ (fatig4a_z * -
0.009) + (slpd4a_z *
0.002) + (emot_z *
0.003);
```

```
mh29_z=(phy4a_z * -0.015) +
(painav_z * -0.154) +
(social4a_z * 0.252)
+ (fatig4a_z * -
0.351) + (slpd4a_z *
-0.139) + (emot_z *
-0.257);
```
